

LV8400V

ON Semiconductor®

<http://onsemi.com>

Bi-CMOS IC

Forward/Reverse Motor Driver

Application Note

Overview

The LV8400V is a 1-channel motor driver IC using D-MOS FET for output stage and is able to control 4 modes of forward, reverse, brake, and standby.

As the P/N-channel structure is used in the H-bridge output stage, the LV8400V features minimal number of external component and low on-resistance (0.33Ω typical). This IC is optimal for driving motors that requires high current

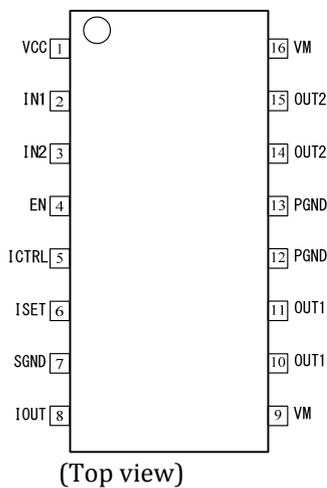

Function

- 1-channel forward/reverse motor driver
- Low power consumption
- Low output ON resistance 0.33Ω
- Built-in constant current output circuit
- Built-in low voltage reset and thermal shutdown circuit
- Four mode function forward/reverse, brake, standby

Typical Applications

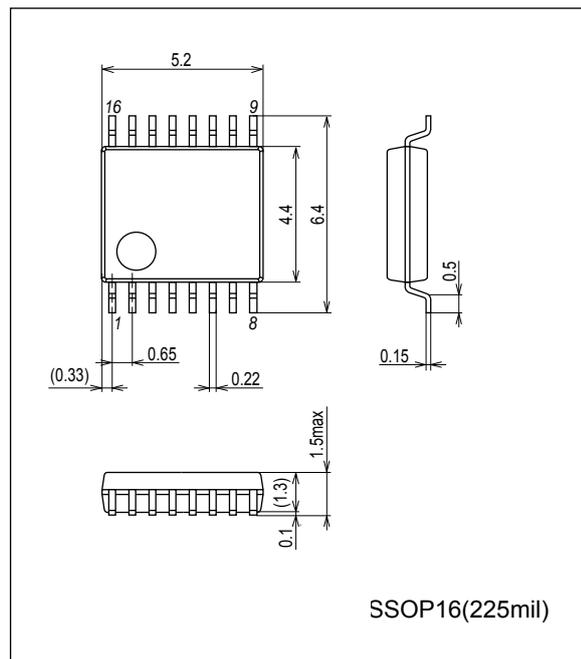

- Digital single-lens reflex camera
- POS Printer

Pin Assignment

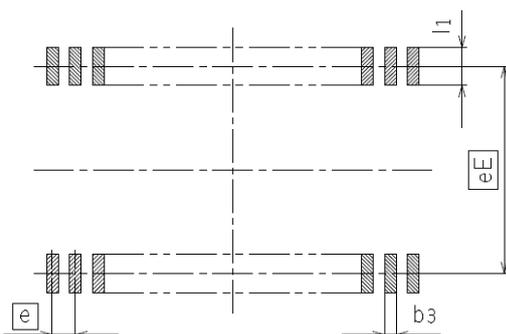

Package Dimensions

Unit : mm(typ)

Recommended Soldering Footprint

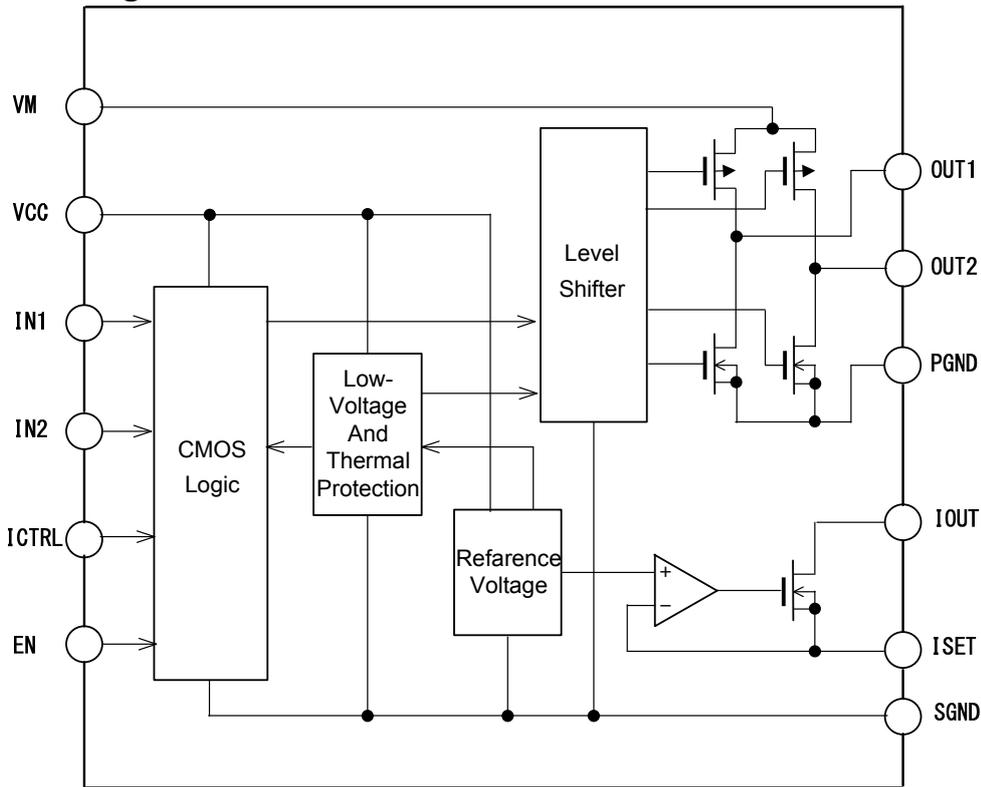

Caution: The package dimension is a reference value, which is not a guaranteed value.

(Unit : mm)

Reference Symbol	SSOP30(225mil)
eE	5.80
e	0.65
b3	0.32
I1	1.00

Specifications

Absolute Maximum Ratings at Ta=25°C, SGND=PGND=0V

Parameter	Symbol	Conditions	Ratings	Unit
Power supply voltage (for load)	VM max		-0.5 to 16.0	V
Power supply voltage (for control)	VCC max		-0.5 to 6.0	V
Output current	IO max	DC	1.2	A
	IO peak1	t ≤ 100ms, f = 5Hz	2.0	A
	IO peak2	t ≤ 10ms, f = 5Hz	3.8	A
	IOUT max	DC	30	mA
Input voltage	VIN max		-0.5 to VCC+0.5	V
Allowable power dissipation	Pd max	Mounted on a specified board *	800	mW
Operating temperature	Topr		-20 to +75	°C
Storage temperature	Tstg		-55 to +150	°C

* Specified board : 30mm × 50mm × 1.6mm, glass epoxy board.

Caution 1) Absolute maximum ratings represent the value which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Power supply voltage (for load)	VM		4		15.0	V
Power supply voltage (for control)	VCC		2.7		5.5	V
Input signal voltage	VIN		0		VCC	V
Input signal frequency	f max	Duty = 50%		200		kHz

* Design guarantee value and no measurement is performed.

Remarks

1. Current consumption when output of the VM pin is off.
2. Current consumption at the V_{CC} pin when all functions are stopped.
3. Current consumption of the VM pin when EN is high.
4. Current consumption of the V_{CC} pin when EN is high.
5. These input pins (EN, IN1, IN2, and ICTRL) have an internal pull-down resistor.
6. Sum of the upper and lower side output on resistance.
7. Leakage current when the constant current output is off.
8. Current value that is determined by dividing the internal reference voltage (0.2V) by RSET.
9. ISET pin voltage when the constant current output block is active.
10. ON resistance value of the constant current output block.
11. All output transistors are turned off if a low-voltage is detected.
12. All output transistors are turned off if the thermal protection circuit is activated. They are turned on again as the temperature decreases.
13. Rising time from 10 to 90% and falling time from 90 to 10% are specified.

Pin Functions

Pin No.	Pin name	Description	Equivalent circuit
9 16	VM	Motor block power supply. (Both pins must be connected) The applicable voltage range is 4.0V to 15.0V. Make sure to connect a bypass capacitor between VM (pin 9 and 16) and PGND (pin 12 and 13) respectively to stabilize power line of VM.	
1	VCC	Logic block power supply. The applicable voltage range is 2.7V to 5.5V. Make sure to connect a bypass capacitor between VCC (pin 1) and SGND (pin 7) to stabilize power line of VM.	
4	EN	Logic enable pin. (Pull-down resistor incorporated) Standby mode is set when the voltage level is Low. Therefore, current consumption is 0. When the voltage level is High, the internal circuit is activated. Since 200kΩ of pull-down resistor is inserted, when OPEN the operation is equivalent to that of Low control signal.	
2 3 5	IN1 IN2 ICTRL	Control signal input pin Driver output switching. (Pull-down resistor incorporated) When the voltage level is High, all the outputs that correspond to inputs are activated. Since 200kΩ of pull-down resistor is inserted, when OPEN the operation is equivalent to that of Low control signal. PWM control is feasible when the input frequency is 200KHz or lower.	
10 11 14 15	OUT1 OUT2	Driver output. This pin is connected to the motor. Operation mode is determined according to the state of input pins.	

LV8400V Application Note

Pin No.	Pin name	Description	Equivalent circuit
6 8	ISET IOUT	Constant current output. ON/OFF of the internal Nch MOS is determined according to the state of ICTRL. By connecting current sense resistor with ISET(pin 6) and SGND (pin 8), you can sink constant current from IOUT(pin 8).	
7	SGND	Logic block ground.	
12 13	PGND	Drivers block ground. (Both pins must be connected)	

LV8400V Application Note

Operation explanation

Saturation drive H bridge

H bridge drive is integrated which enables controlling 4 modes of forward, reverse, brake, and standby.

Logic input specifications

EN	IN1	IN2	OUT1	OUT2	Mode
H	H	H	L	L	Brake
	H	L	H	L	Forward
	L	H	L	H	Reverse
	L	L	Z	Z	Standby
L	-	-	Z	Z	All function stop

EN	ICTRL	IOUT	Mode
H	H	ON	Constant current ON
	L	Z	Constant current OFF
L	-	Z	All function stop

- : denotes a don't care value. Z: High-impedance

When IN1 and IN2 are "Low", the operation of H bridge output stage is in standby mode.

When "high" is input to the input pin, the output transistor of the H bridge output stage operates and the operation shifts as follows: forward, reverse, and brake.

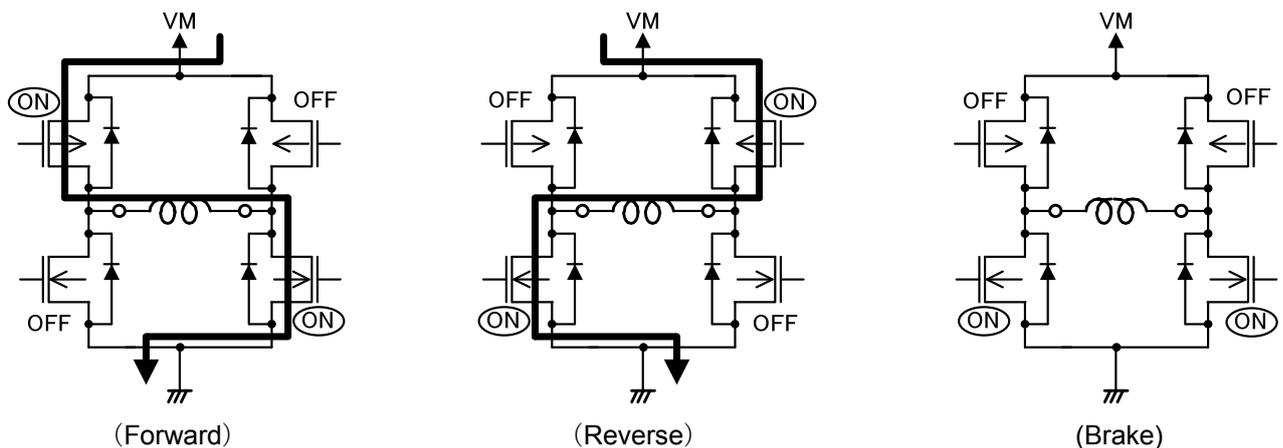

Figure 16. Output stage transistor function

- Current drain is zero in all function stop mode. (excluding the current that flows out of the EN pin)

- * All power transistors turn off and the motor stops driving when the IC is detected in low voltage or thermal protection mod

LV8400V Application Note

Constant current output circuit

Since you can sink constant current of 30mA at a maximum, this motor driver can be used for LED. The output constant current (IOUT) is determined by the internal reference voltage and the sense resistor between the ISET and SGND pins.

$I_{OUT} = \text{Internal reference voltage (0.2V)} \div \text{Sense resistor (RSET)}$

IOUT calculating formula

$$I_{OUT} = \frac{0.2[V]}{RSET}$$

(Ex.) Setup to IOUT=5.0[mA]

$$I_{OUT} = \frac{0.2[V]}{40\Omega} \cong 5.0[mA]$$

From the formula above, IOUT = 5mA when a sense resistor of 40Ω is connected between the ISET and SGND.

Thermal shutdown function

This IC includes thermal shutdown circuit.

The thermal shutdown circuit is incorporated and the output is turned off when junction temperature Tj exceeds 180°C. As the temperature falls by hysteresis, the output turned on again (automatic restoration).

The thermal shutdown circuit does not guarantee the protection of the final product because it operates when the temperature exceed the junction temperature of Tjmax=150°C.

Thermal shutdown temperature = 180°C (typ)

VCC Low voltage malfunction prevention

This IC includes the function of VCC Low voltage malfunction prevention.

When the supply voltage of VCC lowers down to approximately 2.25V (typ), H bridge output stage shifts from operation mode to standby mode. On the other hand, when the supply voltage of VCC increases to approximately 2.35V, H bridge output stage shifts to operation mode.

VCC low-voltage cutoff voltage = 2.25V(typ)

Application Circuit Example

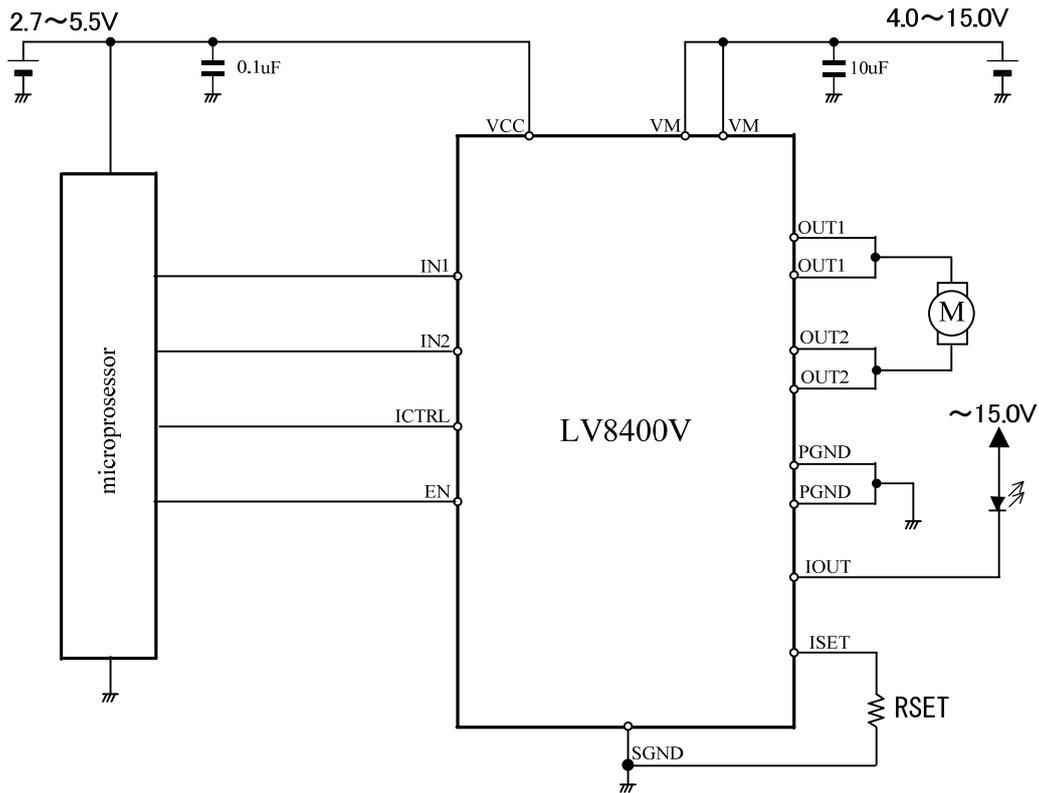

Figure 17. Sample Application Circuit

* : Connect a bypass capacitor as close as possible to the IC to absorb kickback. Characteristics of the IC may be damaged if an instantaneous voltage surge exceeds the maximum ratings in VM line due to coil kickback or other causes.

Bypass capacitor has no specific regulation on electrolytic capacitor or ceramic capacitor. However, it is recommended that the value of capacitor should be as high as possible. When capacitor with high capacitance is used, charge current to capacitor increases. Hence, caution is required for the battery's capability of current supply.

Recommendation value

- Between VM and PGND: 10uF or higher
- Between VCC and SGND: 0.1uF or higher

LV8400V Application Note

Operation setting of DC motor

When you drive DC motor with LV8400V, caution is required to switch motor rotation from forward to reverse because when doing so, electromotive force (EMF) is generated and in some cases, current can exceed the ratings which may lead to the destruction and malfunction of the IC .

Coil current (I_o) for each operation is obtained as follows when switching motor rotation from forward to reverse.

- Starting up motor operation:

$$\text{Coil current } I_o(A) = \frac{VM - EMF(V)}{\text{Coil resistance}(\Omega)}$$

At startup, I_o is high because EMF is 0. As the motor starts to rotate, EMF becomes higher and I_o becomes lower.

- When switching motor rotation from forward to reverse:

$$\text{Coil current } I_o(A) = \frac{VM + EMF(V)}{\text{Coil resistance}(\Omega)}$$

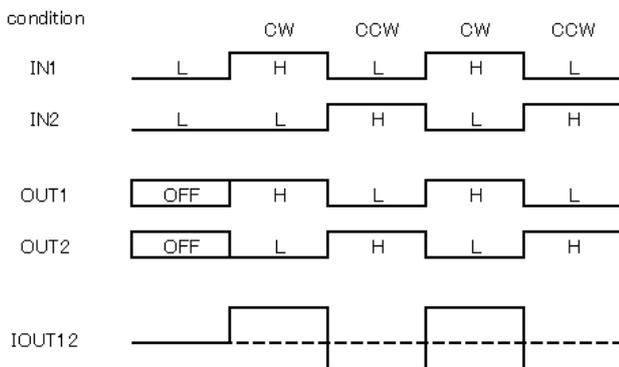

When EMF is nearly equal to VCC at a max, make sure that the current does not exceed I_{omax} since a current which is about double the startup current may flow at reverse brake.

- Brake:

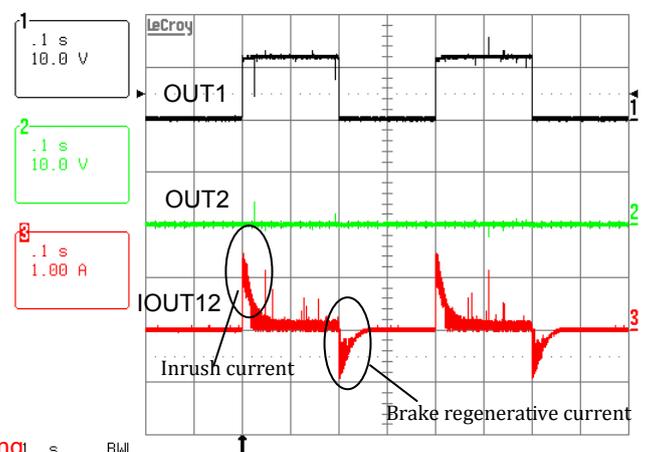

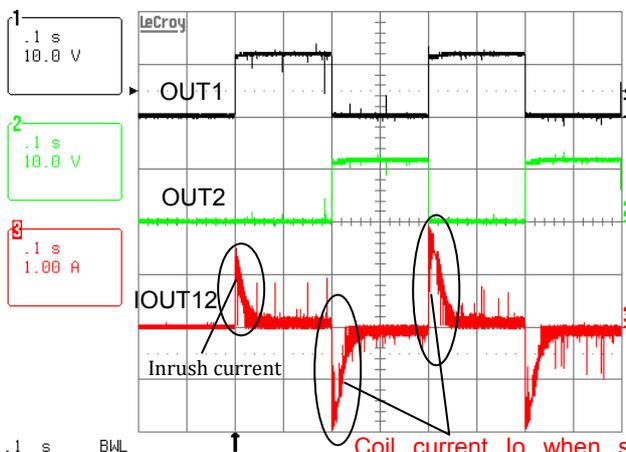

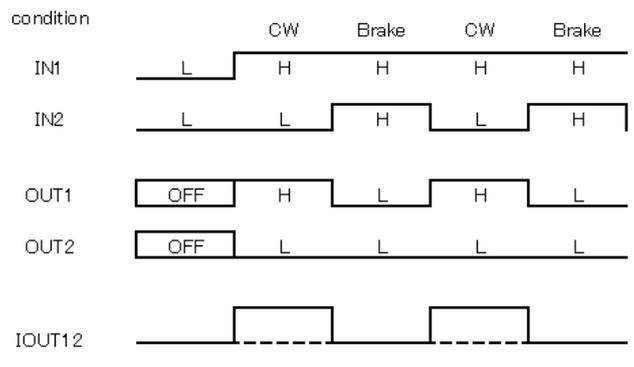

$$\text{Coil current } I_o(A) = \frac{EMF(V)}{\text{Coil resistance}(\Omega)}$$

Since EMF is 0 when the rotation of motor stops, I_o is 0 as well.

CW(Forward) - CCW(Reverse)

CW(Forward) - Brake

Coil current I_o when switching from forward to reverse

Figure 18. Driving waveform of DC motor

When you switch motor rotation from forward to reverse, if I_{out} is higher than I_{omax} , you can operate short brake mode between forward and reverse either to slow down or stop the motor.

LV8400V Application Note

Input and output characteristics of H-Bridge

LV8400V can be driven by direct PWM control of H-Bridge by inputting PWM signal to IN.

However output response of H-Bridge worsens around On-duty 0%, which generates dead zone. As a result, IC control loses linearity.

If you intend to drive motor in such control range, make sure to check the operation of your motor.

LV8400V Application Note

2. DC motor drive

- Connect a DC motor with OUT1 and OUT2.
- Connect the motor power supply with the terminal VM, the control power supply with the terminal VCC. Connect the GND line with the terminal GND.
- You can drive DC motor by setting EN=High and switching the input signal as follows.

EN	IN1	IN2	OUT1	OUT2	Mode
H	H	H	L	L	Brake
	H	L	H	L	Forward
	L	H	L	H	Reverse
	L	L	Z	Z	Standby
L	-	-	Z	Z	All function stop

When you drive DC motor with LV8400V, caution is required to switch motor rotation from forward to reverse because when doing so, electromotive force (EMF) is generated and in some cases, current can exceed the ratings which may lead to the destruction and malfunction of the IC .

See p.11 for the further details.

LV8400V Application Note

- By setting ICTRL to High, constant current output circuit operates.

Since you can sink the constant current of 30mA at a maximum, this IC can be used for LED.

The output constant current (I_{OUT}) is determined by the internal reference voltage and the sense resistor between the ISET and SGND pins.

$I_{OUT} = \text{Internal reference voltage (0.2V)} \div \text{Sense resistor (RSET)}$

IOUT calculating formula

$$I_{OUT} = \frac{0.2[V]}{RSET}$$

(Ex.) Setup to $I_{OUT}=5.0[mA]$

$$I_{OUT} = \frac{0.2[V]}{40\Omega} \cong 5.0[mA]$$

If necessary, please use LED to confirm the operation of the IC.
